Coelite's LEC Technology Named Time's Best of 2006

TIME Magazine named Coelite's light-emitting capacitor (LEC) technology as one of the "Best Inventions of 2006." Nominated by *Time's* team of writers and researchers, Coelite's LEC panels were chosen for the magazine's issue dedicated to the best inventions of the year.

The LEC panels turn any surface into a light source, and can be used for both indoor and outdoor applications, such as bus advertising, street-intersection signage and window displays. Recent applications include: a massive, interactive, illuminated window display that features Madonna at H&M's New York City flagship store; a sound-activated, illuminated drum set for Chad Smith of the Red Hot Chili Peppers; and the CNN Headline News set.
